

Cabio Sales OS — UAT Access Setup (Laptop & Mobile)

Purpose: step-by-step instructions to follow along live during tonight's orientation session on Google Meet — set this up on your own laptop and/or phone while Basheer walks through the app.

UAT URL and your login (email + password) are in the WhatsApp group message — this document is the setup steps only, sent as an attachment in the same group.

Works identically on laptop and phone — no app store, no separate download. On mobile it can also be installed as an app icon on the home screen (see below); on laptop it runs as a normal browser tab, or can be installed as a desktop app the same way.

Login: use the email and password from the WhatsApp group message. Each person has their own account — do not share logins.

Opening this document: tap it in WhatsApp to open it, same as any other file WhatsApp sends you. Once it's open, use the URL from the group message (not a link inside this document) for the steps below — see the in-app browser note under your platform, since tapping a link from inside WhatsApp or its document viewer can behave differently than tapping it in your regular browser.

Laptop / Desktop

1. Open **Chrome** or **Edge** and go to the UAT URL from the WhatsApp group message.
2. Log in with your email and password.
3. That's it — no install required. Keep the tab open, or bookmark it.
4. **Optional — install as a desktop app:** in Chrome/Edge, click the install icon in the address bar (a small monitor-with-arrow icon, right side of the address bar) → **Install**. This opens the app in its own window without browser tabs/toolbars, and adds a shortcut to your desktop/start menu.

Mobile — Android (Chrome)

Since you're getting the link from WhatsApp, tapping it directly will likely open WhatsApp's own built-in browser instead of Chrome — the Install option won't be there in that view. Tap the **:** or **share** icon in that in-app browser first and choose **Open in Chrome**, then continue below.

1. Open the UAT URL from the WhatsApp group message in **Chrome** (see note above).
2. Log in with your email and password.
3. Tap the **:** menu (top right) → **Install app** (or you may see an "Add to Home screen" banner appear automatically — tap **Install** on that instead).
4. Confirm. The Cabio icon appears on your home screen / app drawer.

5. Launch from that icon going forward — opens full-screen, no browser address bar, like a regular app.

Mobile — iPhone (Safari)

Must use Safari — Add to Home Screen only works from Safari on iOS, not Chrome.

Since you're getting the link from WhatsApp, tapping it directly will likely open WhatsApp's own built-in browser instead of Safari — the Add to Home Screen option won't be there in that view. Tap the **share** or **...** icon in that in-app browser first and choose **Open in Safari**, then continue below.

1. Open the UAT URL from the WhatsApp group message in **Safari** (see note above).
 2. Log in with your email and password.
 3. Tap the **Share** icon (square with an upward arrow, bottom toolbar).
 4. **Scroll down** and tap **Add to Home Screen** → **Add**.
 5. The Cabio icon appears on your Home Screen.
 6. Launch from that icon going forward — opens full-screen, no Safari address bar, like a regular app.
-

Notes

- First load after a period of inactivity may take a few extra seconds — the backend server briefly "wakes up." This should be rare during active use, but if a screen seems to hang on first load, wait ~30 seconds and retry before assuming something's wrong.
- This is a test environment (UAT) with a fresh, small dataset — some accounts/hospitals you work with may not be in the system yet. Add them as you go; that's expected and part of what this session is for.
- If login fails or a screen shows an unexpected error, note exactly what you did and what the error said, and flag it during the session rather than retrying repeatedly — it may be something worth fixing on the spot.
- If the installed app looks outdated or stuck after an update, fully close it (swipe it away from your recent-apps list) and reopen from the home screen icon — this clears a stale cached version.
